

***Finally  
A Convenience Store  
Temperature Control  
Package That  
Really Works.***

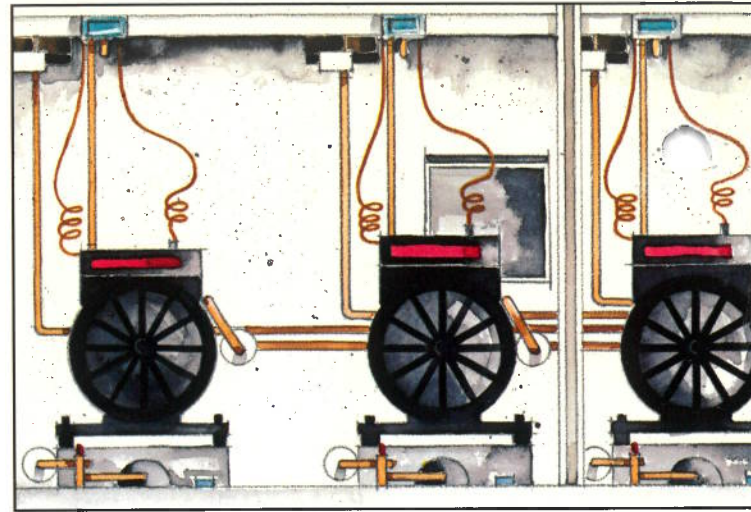

## 1 Air Conditioning.

The Russell All-Pak's fully integrated air conditioning and heating system has been specially designed for convenience stores.

Air conditioning is available from 5 to 10 tons of cooling capacity. The 6.5, 8 and 10 ton units use dual compressors for maximum efficiency and economical operation. With the Economizer, store temperature and humidity are maintained using outside air whenever the outside temperature and humidity are lower than store conditions, reducing costs automatically.

# Introducing the Russell All-Pak. The New 3 in 1 Refrigeration and Environmental Control System For Convenience Stores.

**Russell's built-up systems for convenience stores have outperformed the industry year after year. Superior engineering and manufacturing quality is built into our unique 3-in-1 design for stores where space is at a premium.**

All great ideas are simple ones. Over the past 35 years we've manufactured thousands of built-up systems for Convenience and Fast Food stores. During that time our component products have earned us an unparalleled reputation for reliability and solid quality. It stands to reason you get the best results when you start off with the best. That's the idea behind The Russell All-Pak.

### Efficient Energy Control.

Each of the Russell All-Pak components are specifically engineered to work together. This sophisticated design maximizes the efficiency of 3-in-1 operation—Refrigeration, Air Conditioning and Heating.

To further enhance efficiency, additional custom engineered components are available.

If your store needs heat for part of the year, our Heat Reclaim Coil makes heating virtually cost free. By capturing heat discharged by the refrigeration process and recycling

it automatically, you'll save a bundle. You can use this heat in the winter or to aid the dehumidification process during the hot, humid summer months.

Whenever outside temperature and humidity are low, the Russell All-Pak System's Economizer pulls in variable amounts up to 100% of fresh, free air to cool your store interior.

The Environmental Control Package automatically selects the most energy efficient way to maintain your store temperature. Air conditioning, heating and humidity control are done in stages, first using outside air, when acceptable, or heat from the refrigeration process before employing energy you have to pay for.

### A More Flexible System.

The Russell All-Pak has been created to maintain the full range of convenience store temperature control requirements.

Whether you are a Mom and Pop operation, a franchise or a large chain; whether you've got just a reach-in or a whole wall of walk-ins, the addition of such heat producing elements as a chicken broaster or four pots of steaming coffee can really heat up your store interior and completely alter the demands on the environmental temperature control system.

Because our 3-in-1 system has so much built in flexibility, we can adapt it to your specific needs for now and for the future.

No matter what the size of the building you're in, no matter the budget, whether you need a roof-mounted unit or ground-mounted, Russell can fit your specs snugly.

### Easy, Convenient Installation.

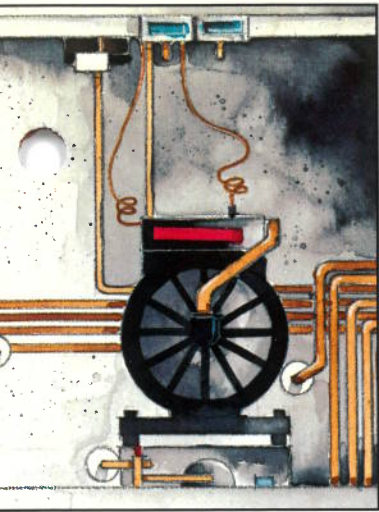

The Russell All-Pak has been thoughtfully designed to overcome some common problems of installation.

Unlike most systems, the Russell All-Pak minimizes roof penetration. Naturally, the fewer holes and the smaller the holes, the less likelihood of leakage. No peeling ceilings and monumental carpet bills. It also means less energy is likely to be lost and operating efficiency can be increased.

In addition, our system uses a single point electrical connection which significantly reduces electrical wiring and labor costs.

There's just one package to ship.

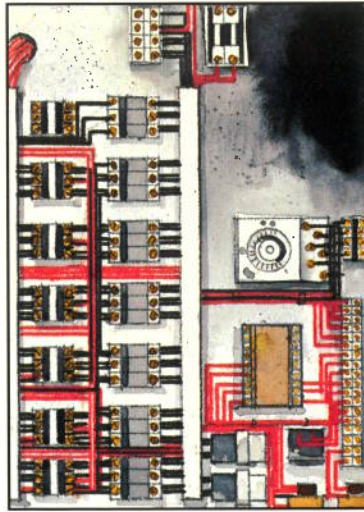

**2 Refrigeration.**  
The Russell All-Pak holds from one to four compressors. A wide range of refrigeration compressors are available, from 1 to 7½ HP, for low, medium and high temp applications.

All necessary piping and refrigeration accessories such as driers and filters and the necessary electrical controls are included. All elements are balanced for the most efficient operation under all ambient temperature conditions.

Refrigeration units with Heat Reclaim valves divert heat from the refrigeration process, when needed, to the Heat Reclaim coil automatically.

**3 Environmental Control Package.**  
The Environmental Control Package (ECP1 or ECP2) for the Russell All-Pak controls air conditioning, dehumidification and heating functions at the desired levels and at the lowest cost.

It automatically selects the most economical and efficient mode and can readjust to your store's particular requirements under changing conditions.

In addition to these features, the ECP 2 may be programmed for up to seven days as well as automatic night set-back which can create additional savings for you.

One package to lift. One package to install. That adds up to three more ways to save on installation.

### Single-Source Engineering.

When the demand for reliability and solid performance are paramount, that's when the Russell All-Pak

really shows its stuff. Because our All-Pak is a product of single source engineering and manufacture, you can depend upon it under conditions where the traditional field-engineered, mix and match system might be questionable.

The 3-in-1 System is such a simple

and totally integrated one, there are fewer places where things can go wrong, and all controls for the entire system are in one convenient location.

The Russell All-Pak System components are virtually trouble free. You get a completely balanced, integrated system, which is 100% factory tested.

### A Class Act, Inside and Out.

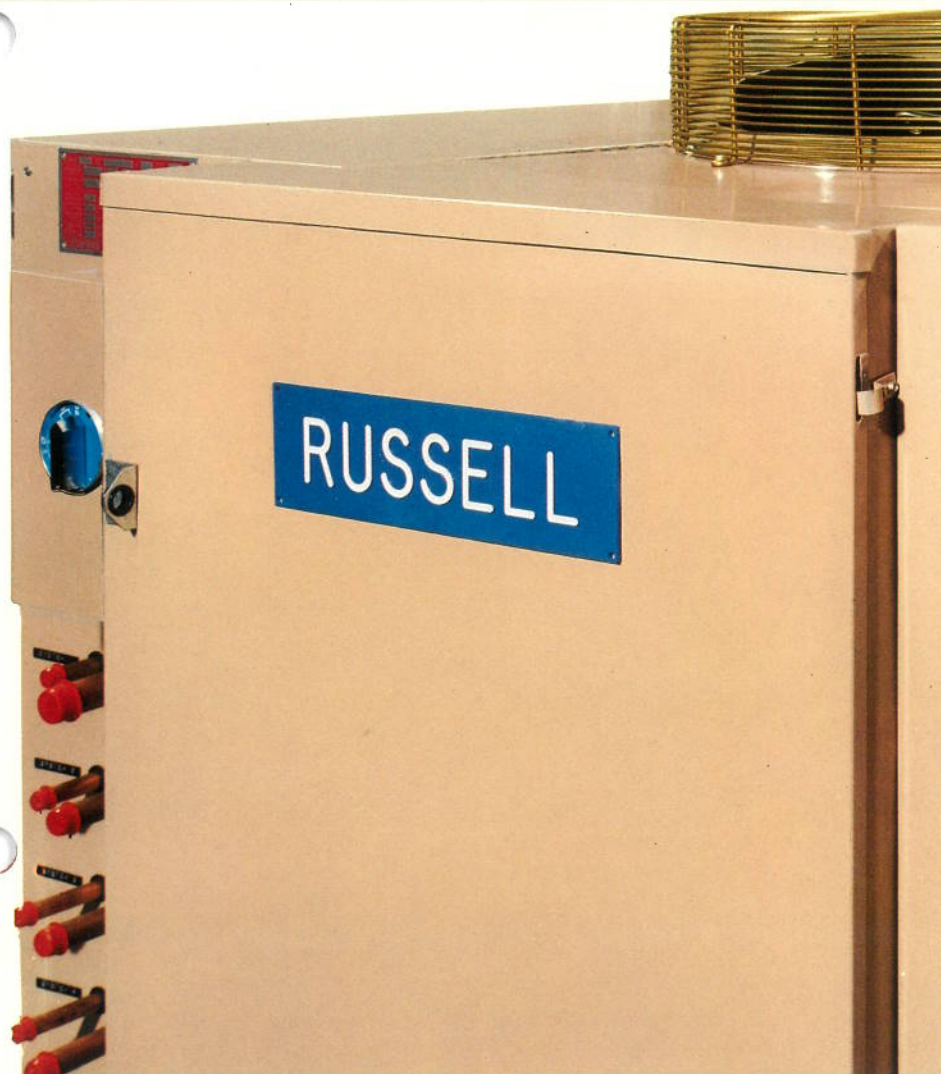

One look at the Russell All-Pak clearly distinguishes it from the field.

Its neat and attractive, low profile configuration, and obvious attention to detail speak clearly of a superior product.

From the individual components and system engineering to the trim outside package, the Russell All-Pak is definitely in a class by itself.

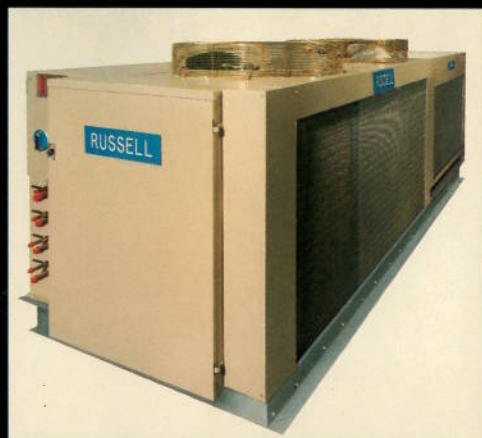

For a free consultation on your store requirements, call the experts. We'll give you a computer generated load analysis based on your specs without any obligation.
